

# Parallel Computing in R

Xie Chao

[xiechoao@nus.edu.sg](mailto:xiechoao@nus.edu.sg)

# Why Parallel Computing?

- Data
  - Large amount of data
  - Large amount of computation
- Computer
  - Multicore processor
  - Many multicore processors
- Many data analysis procedures are embarrassingly parallel

# Different Scales

- Multi-core computer
- Simple network of several computers
- Linux cluster with many computers

# Different Scales in R

- Multi-core computer
  - multicore
- Simple network of several computers
  - snow
- Linux cluster with many computers
  - RMpi, snow

(<http://trg.apbionet.org/euasiagrid/docs/parallelR.notes.pdf>)

# Example

- Find palindrome regions in *C. elegans* chromosomes
- “Super” *C. elegans* with 10X larger genome

# Install

```
# multicore package
install.packages("multicore")

# example data
source("http://bioconductor.org/biocLite.R")
biocLite("BSgenome.Celegans.UCSC.ce2")
```

Requirements for this workshop:  
Linux or Mac,  
(multicore) laptop or server,  
no Windows

```
# load C elegans genome
library(BSgenome.Celegans.UCSC.ce2)

# overview of the genome
Celegans

# chromosomes in celegans
seqnames(Celegans)

# creating the super bug, with 10X larger genome
chrs <- rep(seqnames(Celegans), 10)
chrs
elegan <- getSeq(Celegans, chrs, as.character = F)
elegan

# convert to a list of chromosomes
elegan <- as.list(elegan)
elegan

# individual chromosomes
elegan[[1]]
elegan[[2]]
elegan[[10]]
```

# Create Super Celegans

# Find Palindromes

```
findPalindromes(elegan[[1]])  
findPalindromes(elegan[[2]])  
findPalindromes(elegan[[3]])  
# a “for” loop ???
```

# the R way: lapply

```
> mylist <- list(1:5, 1:10)

> mylist[[1]]
[1] 1 2 3 4 5

> mylist
[[1]]
[1] 1 2 3 4 5

[[2]]
[1] 1 2 3 4 5 6 7 8 9 10

> mean(mylist[[1]])
[1] 3
> mean(mylist[[2]])
[1] 5.5

> lapply(mylist, mean)
[[1]]
[1] 3

[[2]]
[1] 5.5
```

- `lapply(list, FUN)`
- apply the function `FUN` to each element of the list

# serial computing

```
> system.time(pld2 <- findPalindromes(elegan[[2]]))
  user  system elapsed
0.960   0.010   0.971
> pld2

> system.time(pld20 <- findPalindromes(elegan[[20]]))
  user  system elapsed
1.130   0.030   1.153
> pld20

> system.time(plds <- lapply(elegan, findPalindromes))
  user  system elapsed
86.290   0.190  86.696
> plds[[2]]
> plds[[20]]
```

```

All cores are being utilized

(note: I have only 4 cores, not 8)

# one more example

```
> system.time(di.a <- lapply(elegan, dinucleotideFrequency))
  user  system elapsed
5.660   0.000   5.684
> di.a[[2]]
> di.a[[20]]

> library(multicore)
> system.time(di.b <- mclapply(elegan, dinucleotideFrequency))
  user  system elapsed
65.120   2.610   1.824
> di.b[[2]]
> di.b[[20]]
```

# Changing parameters...

## Usage:

```
findPalindromes(subject, min.armlength=4, max.looplength=1, min.looplength=1, min.palindromeArmLength(x, max.mismatch=0, ...)  
palindromeLeftArm(x, max.mismatch=0, ...)  
palindromeRightArm(x, max.mismatch=0, ...)
```

```
findComplementedPalindromes(subject, min.armlength=4, max.looplength=1, min.looplength=1, min.complementedPalindromeArmLength(x, max.mismatch=0, ...)  
complementedPalindromeLeftArm(x, max.mismatch=0, ...)  
complementedPalindromeRightArm(x, max.mismatch=0, ...)
```

## Arguments:

**subject:** An XString object containing the subject string, or an XStringViews object.

**min.armlength:** An integer giving the minimum length of the arms of the palindromes (or complemented palindromes) to search for.

**max.looplength:** An integer giving the maximum length of "the loop" (i.e. the sequence separating the 2 arms) of the palindromes (or complemented palindromes) to search for. Note that by default ('max.looplength=1'), 'findPalindromes' will search for strict palindromes (or complemented palindromes) only.

> ?findPalindromes

> findPalindromes(elegan[[2]], min.armlength = 6, max.looplength = 5)

## with non-default parameters

```
> system.time(plds <- lapply(elegan, findPalindromes,  
min.armlength = 6, max.looplength = 5))  
  user  system elapsed  
67.070  0.300  67.541  
> plds[[2]]  
> plds[[20]]  
  
> library(multicore)  
> system.time(pldmc <- mclapply(elegan, findPalindromes,  
min.armlength = 6, max.looplength = 5))  
  user  system elapsed  
132.930  6.570  16.283  
> pldmc[[2]]  
> pldmc[[20]]
```

# Longest palindrome region?

```
# define our own function
> longest.palindrome <- function(s) {
  pld <- findPalindromes(s);
  pld.width <- width(pld);
  longest <- which.max(pld.width);
  pld[longest]
}

> system.time(pldmc <- mclapply(elegan, longest.palindrome))
  user  system elapsed
135.000   7.360  19.827

> pldmc
```

```

> pldmc

# Beyond Multicore...

# Example

- geneData: 500 genes x 26 samples
- Correlation between every pair of genes with bootstrapping

# Data & Compute

```
# the data
```

```
library(Biobase)          # load package
data(geneData)           # load data
fakeData <- cbind(geneData, geneData, geneData, geneData)
```

```
# the compute
```

```
library(boot)
geneCor2 <- function(x, gene = fakeData) {
  mydata <- cbind(gene[x[1], ], gene[x[2], ])
  mycor <- function(x, i) cor(x[i,1], x[i,2])
  boot.out <- boot(mydata, mycor, 1000)
  boot.ci(boot.out, type = 'bca')$bca[4:5]
}
pair <- combn(1:nrow(geneData), 2, simplify = F)
pair2 <- sample(pair, 300) # let's do 300 pairs
```

# Serial vs Multicore

```
# serial
```

```
> system.time(out <- lapply(pair2, geneCor2))  
  user  system elapsed  
71.450   0.290  71.997
```

```
# multicore
```

```
> system.time(out <- mclapply(pair2, geneCor2))  
  user  system elapsed  
108.650   1.060  15.969
```

# Multiple Machines

- Simple Network Of Workstations (snow)
- snow package by Luke Tierney, A. J. Rossini, Na Li, H. Sevcikova
- Requirement:
  - SSH access to worker nodes
  - Enable password-less login (public key)
  - R package snow installed on all nodes

# parallel computing with snow

```
> library(snow)

> hosts <- c("localhost", "137.132.x.x", "137.132.y.y")
> cl <- makeCluster(rep(hosts, 2))
           # two worker per machine

> clusterExport(cl, "fakeData")
           # export data to workers
> clusterEvalQ(cl, library(boot))
           # load package on workers

> system.time(out <- clusterApply(cl, pair2, geneCor2))

> stopCluster(cl)
```

# Cluster

- multicore and multi-machine snow are too slow for you
- Large cluster with MPI support
  - NUS HPC cluster
  - 32 processor-cores per job

# | Master + 3 | Workers

( submit job through MPI environment )

```
> cl <- makeCluster()
> clusterExport(cl, 'fakeData')
> clusterEvalQ(cl, library(boot))
> system.time(out2 <- clusterApply(cl, pair2, geneCor2))
  user  system elapsed
2.373   0.001   2.374
```

single-core: 72  
quad-core: 16

# Problem

- How to maintain your code for
  - single core
  - multicore
  - snow
  - cluster with MPI support

# *“one ring to rule them all”*

- The foreach framework
  - by Revolution Analytics
  - open source
- Unified interface for packages:
  - multicore => doMC
  - snow => doSNOW
  - Rmpi => doMPI

# The Serial Code

```
#!/usr/bin/env Rscript
library(foreach)

data(geneData, package = 'Biobase')
pair <- combn(1:nrow(geneData), 2, simplify = F)
fakeData <- cbind(geneData, geneData, geneData, geneData)
pair2 <- sample(pair, 300)

print(system.time(
  out <- foreach(p = pair2, .packages = 'boot', .combine = 'rbind') %dopar%
  {
    mydata <- cbind(fakeData[p[1],], fakeData[p[2], ])
    mycor <- function(x, i) cor(x[i,1], x[i,2])
    boot.out <- boot(mydata, mycor, 1000)
    ci <- boot.ci(boot.out, type = 'bca')$bca[4:5]
    c(p, ci)
  }
))
print(head(out))
